

## How to find the concentration of sulfuric acid (H<sub>2</sub>SO<sub>4</sub>), HSO<sub>4</sub><sup>-</sup> and SO<sub>4</sub><sup>2-</sup>

In some biological systems sulfate (SO<sub>4</sub><sup>2-</sup>) play an important role as an electron acceptor for various microbial processes such as anaerobic respiration.

When sulfate is present some HSO<sub>4</sub><sup>-</sup> is present as well and in very acidic solutions H<sub>2</sub>SO<sub>4</sub> is present. How much can be found of each depend among others on pH.

To calculate individual concentrations of H<sub>2</sub>SO<sub>4</sub>, HSO<sub>4</sub><sup>-</sup> and SO<sub>4</sub><sup>2-</sup> we start by defining their ionization or dissociation constant for sulfuric acid and each of the ions HSO<sub>4</sub><sup>-</sup> and SO<sub>4</sub><sup>2-</sup>. In each case another derivation has been made that is to be used later on.

$$K_a^{\text{HSO}_4^-} = \frac{\text{H}^+ \cdot \text{SO}_4^{2-}}{\text{HSO}_4^-} \Rightarrow \frac{\text{HSO}_4^-}{\text{H}^+ \cdot \text{SO}_4^{2-}} = \frac{1}{K_a^{\text{HSO}_4^-}}$$

$$K_a^{\text{H}_2\text{SO}_4} = \frac{\text{H}^+ \cdot \text{HSO}_4^-}{\text{H}_2\text{SO}_4} \Rightarrow \frac{\text{H}_2\text{SO}_4}{\text{H}^+ \cdot \text{HSO}_4^-} = \frac{1}{K_a^{\text{H}_2\text{SO}_4}}$$

$$K_a^{\text{HSO}_4^-} \cdot K_a^{\text{H}_2\text{SO}_4} = \frac{\text{H}^+ \cdot \text{SO}_4^{2-}}{\text{HSO}_4^-} \cdot \frac{\text{H}^+ \cdot \text{HSO}_4^-}{\text{H}_2\text{SO}_4} = \frac{\text{H}^+ \cdot \text{H}^+ \cdot \text{SO}_4^{2-}}{\text{H}_2\text{SO}_4}$$

When this is done we need to establish the relationship between total concentration of H<sub>2</sub>SO<sub>4</sub>, HSO<sub>4</sub><sup>-</sup> and SO<sub>4</sub><sup>2-</sup> and the dissociation constants and their derivations as derived above. Here, THSO is total sulfur on those three forms.

$$\text{THSO} = \text{H}_2\text{SO}_4 + \text{HSO}_4^- + \text{SO}_4^{2-} = \text{HSO}_4^- \left(1 + \frac{\text{H}_2\text{SO}_4}{\text{HSO}_4^-} + \frac{\text{SO}_4^{2-}}{\text{HSO}_4^-}\right)$$

In this case HSO<sub>4</sub><sup>-</sup> is isolated from sulfuric acid and sulfate.

$$\text{HSO}_4^- = \frac{\text{THSO}}{\left(1 + \frac{\text{H}_2\text{SO}_4}{\text{HSO}_4^-} + \frac{\text{SO}_4^{2-}}{\text{HSO}_4^-}\right)} = \frac{\text{THSO}}{\left(1 + \frac{\text{H}^+ \cdot \text{H}_2\text{SO}_4}{\text{H}^+ \cdot \text{HSO}_4^-} + \frac{\text{H}^+ \cdot \text{SO}_4^{2-}}{\text{H}^+ \cdot \text{HSO}_4^-}\right)} \Rightarrow$$

$$\text{HSO}_4^- = \frac{\text{THSO}}{\left(1 + \frac{\text{H}^+}{K_a^{\text{H}_2\text{SO}_4}} + \frac{K_a^{\text{HSO}_4^-}}{\text{H}^+}\right)}$$

It's easy to do exactly the same and in this case just isolating sulfate:

$$\text{THSO} = \text{H}_2\text{SO}_4 + \text{HSO}_4^- + \text{SO}_4^{2-} = \text{SO}_4^{2-} \left(1 + \frac{\text{H}_2\text{SO}_4}{\text{SO}_4^{2-}} + \frac{\text{HSO}_4^-}{\text{SO}_4^{2-}}\right)$$

$$\text{SO}_4^{2-} = \frac{\text{THSO}}{\left(1 + \frac{\text{H}_2\text{SO}_4}{\text{SO}_4^{2-}} + \frac{\text{HSO}_4^-}{\text{SO}_4^{2-}}\right)} = \frac{\text{THSO}}{\left(1 + \frac{\text{H}^+ \cdot \text{H}_2\text{SO}_4}{\text{H}^+ \cdot \text{SO}_4^{2-}} + \frac{\text{H}^+ \cdot \text{HSO}_4^-}{\text{H}^+ \cdot \text{SO}_4^{2-}}\right)} \Rightarrow$$

$$\text{SO}_4^{2-} = \frac{\text{THSO}}{\left(1 + \frac{\text{H}^+}{K_a^{\text{H}_2\text{SO}_4}} + \frac{\text{H}^+}{K_a^{\text{HSO}_4^{2-}}}\right)}$$

And the same for sulfuric acid:

$$\text{THSO} = \text{H}_2\text{SO}_4 + \text{HSO}_4^- + \text{SO}_4^{2-} = \text{H}_2\text{SO}_4 \left(1 + \frac{\text{HSO}_4^-}{\text{H}_2\text{SO}_4} + \frac{\text{SO}_4^{2-}}{\text{H}_2\text{SO}_4}\right)$$

$$\text{H}_2\text{SO}_4 = \frac{\text{THSO}}{\left(1 + \frac{\text{HSO}_4^-}{\text{H}_2\text{SO}_4} + \frac{\text{SO}_4^{2-}}{\text{H}_2\text{SO}_4}\right)} = \frac{\text{THSO}}{\left(1 + \frac{\text{H}^+ \cdot \text{HSO}_4^-}{\text{H}^+ \cdot \text{H}_2\text{SO}_4} + \frac{\text{H}^+ \cdot \text{SO}_4^{2-}}{\text{H}^+ \cdot \text{H}_2\text{SO}_4}\right)} =$$

$$\text{THSO} - \text{HSO}_4^- - \text{SO}_4^{2-} = \text{H}_2\text{SO}_4 = \frac{\text{THSO}}{\left(1 + \frac{K_a^{\text{H}_2\text{SO}_4}}{\text{H}^+} + \text{H}^+ \cdot \text{H}^+ \cdot K_a^{\text{HSO}_4^-} \cdot K_a^{\text{H}_2\text{SO}_4}\right)}$$

If you are going to do some charge balance equation calculations using the Newton Raphson equation for solving the balance, its essential to know the differential equations of  $\text{H}_2\text{SO}_4$ ,  $\text{HSO}_4^-$  and  $\text{SO}_4^{2-}$ , so here they are:

$$(\text{SO}_4^{2-})' = \frac{-\text{THSO} \cdot \left(\frac{1}{K_a^{\text{H}_2\text{SO}_4}} + \frac{1}{K_a^{\text{HSO}_4^-}}\right)}{\left(\frac{\text{H}^+}{K_a^{\text{H}_2\text{SO}_4}} + \frac{\text{H}^+}{K_a^{\text{HSO}_4^-}} + 1\right)^2}$$

$$(\text{HSO}_4^-)' = \frac{-\text{THSO} \cdot \left(\frac{1}{K_a^{\text{H}_2\text{SO}_4}} - \frac{K_a^{\text{HSO}_4^-}}{(\text{H}^+)^2}\right)}{\left(1 + \frac{K_a^{\text{HSO}_4^-}}{\text{H}^+} + \frac{\text{H}^+}{K_a^{\text{H}_2\text{SO}_4}}\right)^2}$$
